[www.box.net](http://www.box.net)

## In addition to a 99.9% network uptime guarantee, Box Business and Enterprise customers benefit from:

**Data encryption on transfer**  
Data is encrypted using SSL on transfer.

**Data encryption at rest**  
Data is encrypted on servers using 256-bit AES SSL. *Enterprise only*

**Administrative auditing**  
Manage users, groups and access permissions. Monitor file and user activity.

**Comprehensive reporting tools**  
Drill down and generate reports on user and file activity.

**Sophisticated user password policy enforcement**  
Manage complexity requirements, histories and forced resets.

**AD/LDAP integration**  
Option for Enterprise customers over standard Box authentication. *Enterprise only*

**Role-based access controls**  
Choose editing, viewing, previewing & uploading permissions.

**Password-protection & time-based file controls**  
Apply passwords to shared files & folders and expiration dates for file access.

## Security overview

# Security is our top priority

---

“ Box provides valuable administrative features, which let us easily set granular permission controls across all our content and all our users. ”

## Comprehensive security at every level, for every user

Box.net commits extensive resources to the design, implementation, monitoring and maintenance of our security infrastructure. This includes:

- Highly scalable and redundant online infrastructures
- Constant monitoring of production systems
- Ongoing threat assessments
- Rapid deployment of industry-standard security technologies

Together, from the point users log into Box to how and where files are stored and accessed, protection is built in at every level.

## Protection at the application level

- Files uploaded to Box are private by default - you control what is shared
- Shared files can be made private at any time
- Unique, randomly-generated IDs are applied to links for shared files
- Search engine and robot indexing of public files is blocked

## Protection at the network level

- Servers reside behind sophisticated firewall that selectively grants access to network resources
- External penetration testing performed for system security and validation
- Multiple internet backbone connections provide routing redundancy and high performance connectivity
- Intrusion Detection System (IDS) continuously monitors network traffic

## Protection at the facilities level

- Servers hosted in redundant facilities, which are automatically backed up to a geographically-separated site.
- Data centers implement ongoing audits, 24/7/365 monitoring and surveillance, on-site security staff, mantraps and strict access controls.
- Power systems feature multiple power feeds, UPS devices and backup generators ensure continuous operation
- Environmental systems have N+1 redundant configuration to ensure fault tolerance
